

# Setting up your Yellowfin Platform

This simple guide will allow you to set up your very own Yellowfin instance in no time.

1. First, install the Yellowfin setup on your system. Our [installation](#) page will guide you how to do this, based on the type of installation you choose.
2. The next step after installation would be to [get a license](#) for your instance.
3. After providing the license, you will need to carry out an [initial use](#) and log in to the instance. These [first time log ins](#) are slightly different, as they require the generic user credentials generated by Yellowfin.
4. You can then create your own secure credentials for your instance.
