Administration Services

Yellowfin's Administration Services are used to perform administrative functions, such as perform single sign-ons, manage users and client organizations, and more. Below is a list of all these functions.

Categories of Administration Services

The administration web services are categorized into the following sections.

Category	Description
Single sign-on	This category is related to user authentication services, that allows them to access multiple organizations.
User management	The services displayed in this section involve user management and replication.
Group & role administration	These web services are related to managing user roles and groups.
Client organization management	These web services are used to manage Yellowfin's Client Org. functionality.
User object retrieval & manipulation	The function calls in this category can be used to retrieve or manipulate user objects, mainly report and dashboard details.
Content folder/category management	Use these calls to manage folders/categories and sub-folders/subcategories, including user access.
Export & import content	These group of functions are related to exporting or importing Yellowfin content.
Schedule management	These web services can be used to manage Yellowfin's schedule management functionality.
Cache management	These special set of web services are used to manage caches in a cluster environment.
Data source management	The web services highlighted in this section will allow you to manage your data sources.
Configuration & settings	These web services can be used to manage Yellowfin's configuration settings.
View management	A set of web services to update a Yellowfin view.
Miscellaneous web services	Some additional web services, including some you can use for testing the server, perform SQL queries, manage folders, etc.

A separate section is also included that provides details on the object definitions of administration services.
