Overview

top

Parameters are a unique type of input field within Yellowfin. They can be used to pass values from a user prompt into a calculated field or to have a single entry field for multiple filters.

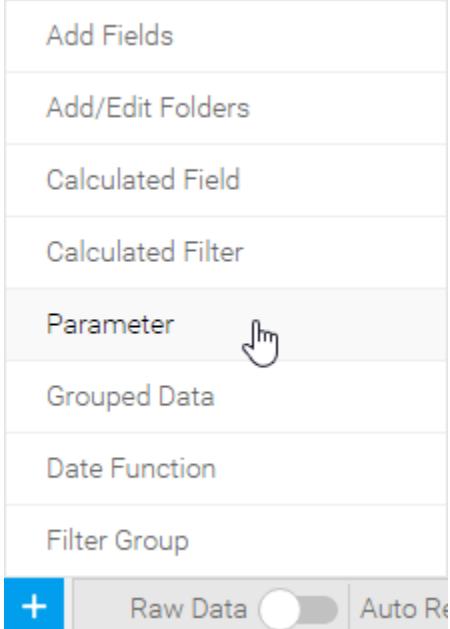

One of the most interesting ways that parameters can be used is in the creation of 'what if' reports. This works by creating calculated fields which use parameters in their calculations. For example if you had a Product Cost field you could create a 'what if' calculation that was "Parameter" x Product Cost where the parameter was the expected units to be sold.

Creating Parameters

top

A parameter field has to be created when a view is created. Generic parameters can be created so that they can be used for user defined calculated fields or filters.

1. Click on the **Create** button and select the **Parameter** option.

- a. Define the **Name** of the parameter. This will be used within the view and report builder.

New Parameter

Parameter name: Margin Increase

Data type: -- Select Data Type --

Field category: -- Select Category --

Submit

- b. Define the **Data Type** of the parameter (the type of value you want the user to provide). Parameters can be:

i. Date

New Parameter

Parameter name: Margin Increase

Data type: Date

Field category: Time

Default value: Dynamic Date

Current Date: + 1 Years

Submit

ii. Numeric

New Parameter

Parameter name: Margin Increase

Data type: -- Select Data Type --

Field category: Date

Numeric

Text

Timestamp

Submit

iii. Timestamp

New Parameter

Parameter name: Margin Increase

Data type: Timestamp

Field category: Time

Default value: Dynamic Date

Current Date: + 60 Seconds

Submit

iv. Text

The screenshot shows the 'New Parameter' dialog box. The 'Parameter name:' field contains 'Margin Increase'. The 'Data type:' dropdown is set to 'Text'. The 'Field category:' dropdown is set to 'Time'. The 'Default value:' field is empty. At the bottom is a blue 'Submit' button.

- c. Define the **Default Value** of the parameter. This will be used until the user provides their own value when the report is run.

The screenshot shows the 'New Parameter' dialog box. The 'Parameter name:' field contains 'Margin Increase'. The 'Data type:' dropdown is set to 'Numeric'. The 'Field category:' dropdown is set to 'Athlete Payment'. The 'Default value:' field contains the number '1'. At the bottom is a blue 'Submit' button, with a mouse cursor hovering over it.

2. Click **Submit** to complete your parameter.

Formatting Parameters

[top](#)

Parameters have different format options from standard filters. The process of changing the format options is however the same. Depending on the type of parameter field you will have different options.

Like filters you can change the display name - this is useful to provide a more relevant user prompt text for the user. In the Entry Style menu there are three formatting options unique to parameters; Field, Dial, and Slider.

1. When you select Field as the entry style you will be able to set the default value for the parameter in the text box on the menu.
2. This will be how your parameter is displayed on the report preview page, when formatted as a Field.
3. When you select the Dial entry style option you will be able to set the colour, minimum, maximum, and default values of the dial.
4. This will be how your parameter is displayed on the report preview page, when formatted as a Dial.
5. When you select the Slider entry style option, you will be able to set the colour, minimum, maximum, and default values of the slider.
6. This will be how your parameter is displayed on the report preview page, when formatted as a Slider.

Numeric Parameters

For numeric parameters you will be able to set:

1. Default Value - the value that will initially be used when the report is run. If a decimal is added to the numeric value, it will be used to define the decimal precision used in the report. If a default value is not entered, parameters may be rounded and this may impact any calculations using that parameter.
2. Display Type - you can choose between text field input or dial and slider. If choosing dial and slider you can choose the image color to be used (grey, black or blue) and set the minimum and maximum values for these input processes.

Text Parameters

For text parameters you will be able to set the default value - this is the value that will initially be used when the report is run.

Date Parameters

For date parameters you will be able to set the default value - this is the value that will initially be used when the report is run.

Linking Filters to Parameters

[top](#)

If you wish to use a parameter as the input for a filter value (you may want to have a single input field for one or more filters that require the same value) then you can do this by setting the filter operator to "equal to column" and select the required parameter column.

Using Parameters in a report

[top](#)

Once your parameters have been defined you can run your report. Unlike standard filters you will have default values defined for parameters so the report will automatically run if you do not have any additional user prompt filters defined.

You will be able to adjust the parameter values using either text box, dial or slider and click the go button to re-run your report to see new values.
