

# Numeric Divide

Yellowfin's Data Transformation module lets you perform a number of transformations directly in the data preview panel.

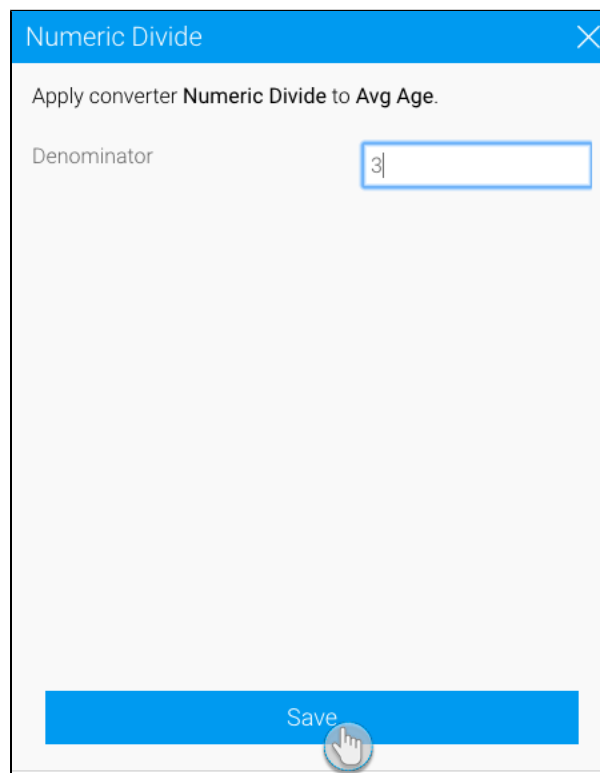

This guide covers the Numeric Divide transformation, used to divide numeric data by a denominator and return the results in the same column.

## Instructions

1. Ensure that the data preview panel contains a numeric field. Expand the type conversion menu of this field.
2. Click on Numeric Divide.

3. In the popup, enter a denominator value to divide the data with. Click Save.

4. The numeric field will then display the result of this division.
