Overview

[top](#)

Parameters are a unique type of input field within Yellowfin. They can be used to pass values from a user prompt into a calculated field or to have a single entry field for multiple filters.

One of the most interesting ways that parameters can be used is in the creation of 'what if' reports. This works by creating calculated fields which use parameters in their calculations. For example if you had a Product Cost field you could create a 'what if' calculation that was "Parameter" x Product Cost where the parameter was the expected units to be sold.

Creating Parameters

[top](#)

A parameter field has to be created when a view is created. Generic parameters can be created so that they can be used for user defined calculated fields or filters.

1. To add a parameter into a calculated field drag it into your filter section

The screenshot shows the 'Definition' tab of a parameter creation interface. It contains the following fields and options:

- Business Name:** Parameter
- Description:** Parameter
- Category:** Calculations (with a link to 'Edit Categories')
- Status:** Active (selected with a radio button), Draft
- Data Type:** Numeric
- Default Value:** 100
- Save** button in the top right corner.

- a. Define the **Data Type** of the parameter (the type of value you want the user to provide). Parameters can be:
 - i. **Date**
 - ii. **Numeric**
 - iii. **Timestamp**
 - iv. **Text**
 - b. Define the **Default Value** of the parameter. This will be used until the user provides their own value when the report is run.
2. Create a calculated field that uses the parameter
You will now be able to define how the parameter is to be used by formatting it on the filters page.

Formatting Parameters

[top](#)

Parameters have different format options from standard filters. The process of changing the format options is however the same. Depending on the type of parameter field you will have different options.

Like filters you can change the display name - this is useful to provide a more relevant user prompt text for the user. In the Entry Style menu there are three formatting options unique to parameters; Field, Dial, and Slider.

1. When you select Field as the entry style you will be able to set the default value for the parameter in the text box on the menu.

The screenshot shows the 'Filter Formatting' dialog box for 'Parameter 1'. The 'Entry style' is set to 'Field'. The 'Value Entry Method' is 'Manual User Entry'. The 'Default Value' is set to '100'. The dialog box has a sidebar with 'Filters' and 'Parameter 1' selected.

Filters

Go

3. When you select the Dial entry style option you will be able to set the colour, minimum, maximum, and default values of the dial.

The screenshot shows the 'Filter Formatting' dialog box for 'Parameter 1'. The 'Entry style' is set to 'Dial'. The 'Value Entry Method' is 'Manual User Entry'. The 'Min' value is '0', the 'Max' value is '200', and the 'Default Value' is '100'. The 'Colour' is set to 'Black'. The dialog box has a sidebar with 'Filters' and 'Parameter 1' selected.

Value Entry Method

The user will select values using a numeric dial.

Manual User Entry ☐

Dial ☒

Slider ☐

Min

Define the minimum value the user can select for this filter.

0

Max

Define the maximum value the user can select for this filter.

200

Colour

Select the colour for the entry style.

Black ☒

Blue ☐

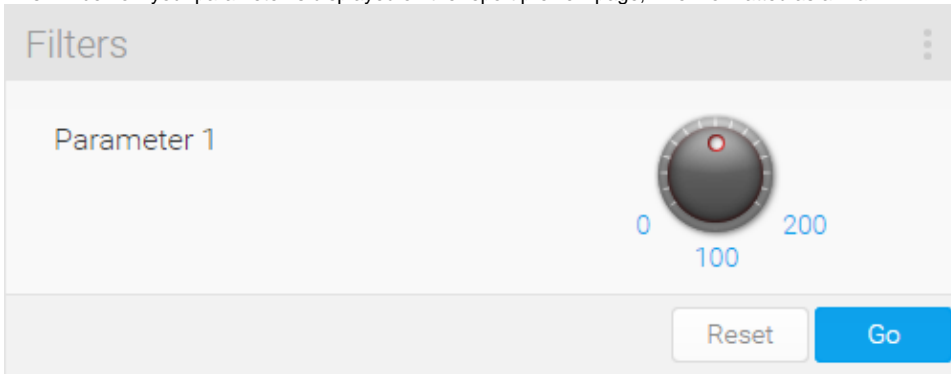

Grey ☐

Default Value

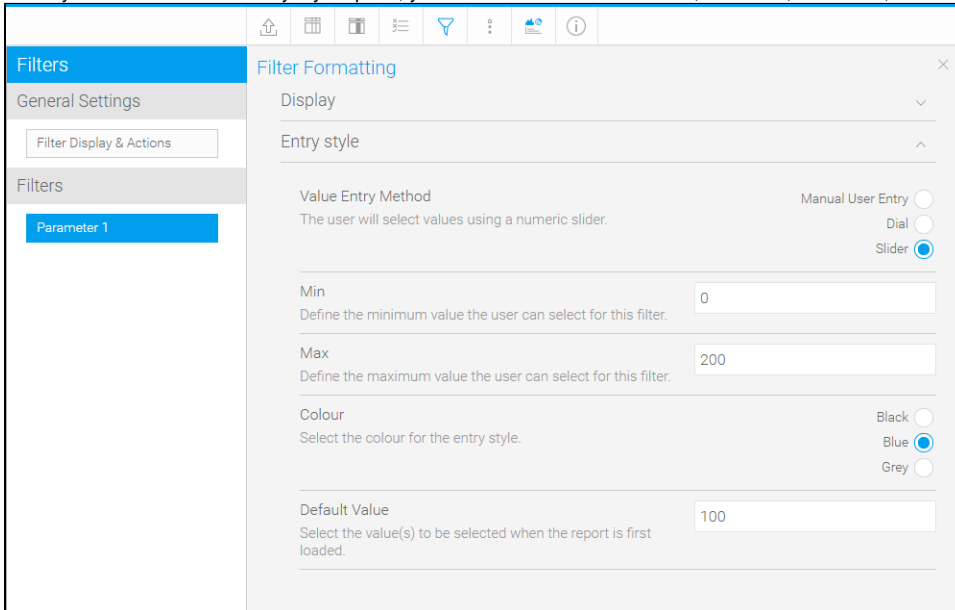

Select the value(s) to be selected when the report is first loaded.

100

4. This will be how your parameter is displayed on the report preview page, when formatted as a Dial.

5. When you select the Slider entry style option, you will be able to set the colour, minimum, maximum, and default values of the slider.

6. This will be how your parameter is displayed on the report preview page, when formatted as a Slider.

Numeric Parameters

For numeric parameters you will be able to set:

1. The default value - the value that will initially be used when the report is run
2. Display Type - you can choose between text field input or dial and slider. If choosing dial and slider you can choose the image colour to be used (grey, black or blue) and set the minimum and maximum values for these input processes.

Text Parameters

For text parameters you will be able to set the default value - this is the value that will initially be used when the report is run

Date Parameters

For date parameters you will be able to set the default value - this is the value that will initially be used when the report is run

Linking Filters to Parameters

[top](#)

If you wish to use a parameter as the input for a filter value (you may want to have a single input field for one or more filters that require the same value) then you can do this by setting the filter operator to "equal to column" and select the required parameter column.

Using Parameters in a report

[top](#)

Once your parameters have been defined you can run your report. Unlike standard filters you will have default values defined for parameters so the report will automatically run if you do not have any additional user prompt filters defined.

You will be able to adjust the parameter values using either text box, dial or slider and click the go button to re-run you report to see new values.
