Google Maps Support

Overview

Version 2.x of the Javascript API includes support for interactive Google Maps reports. For this to work, you must include the Google API script in your page before loading the report. If the Google API script is not available, the report will fall back to a non-interactive version. The Javascript API uses version 3 of the Google Maps API. To use this version of the Google API you will need an API key for the domain that your page will be hosted under.

An example of including the Google API to load interactive Google Maps reports:

```
<!-- include the Google API -->
<script type="text/javascript" src="https://maps.googleapis.com/maps/api/js?key=..."></script>
<!-- embed the Yellowfin report -->
<script type="text/javascript" src="http://localhost/JsAPI?reportUUID=e5e5aaf3-c3b8-4f9b-8280-e21e4d848e63"></script>
```

JavaScript Charts Support

To be able to display JavaScript charts in your page via JavaScript API or web services, these libraries must be included in your script:

<script src="http://<host>:<port>/js/jquery-1.7.2.min.js"></script>

<script src="http://<host>:<port>/js/libs/requirejs/requirejs.js"></script>

<script src="http://<host>:<port>/js/ws.js"></script>
