Overview

[top](#)

When creating a new data source connection, you will need to first specify either the type of source you wish to connect to, or provide/select a third party connector to use.

This page will be dedicated to exploring parameters available when connecting to a database.

See [Third Party Connectors](#) for or [CSV Data Imports](#) for more information on other types of connection.

New Connection Window

[top](#)

When creating your new database connection, you will be presented with a basic list of details to complete.

New Connection

Connection Setti... Create View Analyse

Name:

Description:

Database Type: -- Select --

Username:

Password:

Create View

This will include;

1. **Name**
2. **Description**
3. **Database Type** (from the drivers you have available)
4. **Username**
5. **Password**

Once you have selected your database type, you will be prompted to complete options specific to your connection.

Next Steps

When the basic connection details are complete you will need to choose how you wish to proceed.

New Connection

Connection Setti... Create View Analyse

Name: Ski Team Data

Description: Tutorial data based on the Ski Team business.

Database Type: Microsoft SQL Server

Include Schema in SQL: ☒

Database Host: localhost

Use Named Instance: ☐

Database Port: 1433

Database Name: NewSkiTe

Database Authentication: SQL Auth

SSL Required: Disabled

Advanced Connection Editor
Test Connection
Create View
Save & Close
Cancel

Create View

The following options may be available;

1. **Create View** - this will allow you to continue onto the New View window. See [Creating a View](#) for more information.
2. **Advanced Connection Editor** - this will take you to the advanced options available for your connection, otherwise accessed via the Admin Console.
3. **Test Connection** - this will allow Yellowfin to test the connection information provided to ensure that the database can be reached.
4. **Save & Close** - this will allow you to save your connection and return to the page you were previously on.
5. **Cancel** - this will allow you to close the New Connection window without saving your connection.

Advanced Connection Editor

[top](#)

In order to edit the advanced options of a new or existing connection you will need to access its connection details through either the [Admin Console](#) or the [New Connection Window](#) options. From here you will have a range of options, split into the groups explored below.

Connection Description

This section allows you to define the basic metadata for your connection; **Name**, **Description**, and **Tags**. These items should be descriptive as users will need them in order to identify the connection when building content.

The screenshot shows the 'Advanced Connection Editor' window. On the left is a sidebar with a 'Connection' header and a 'Let's make this easy.' section. Below this, it says 'You can edit and manage your data source connection parameters here.' and 'This includes Connection Settings, Security, and Access Filters.' There are two sections: 'Need help?' with a question mark icon and a link to the Yellowfin forum or wiki, and 'Availability' with a checkmark icon and a message stating 'Available. The connection to this Data Source was successful.' The main area is titled 'Connection' and contains a 'Connection Description' section. This section has a 'Database' icon, a text input field with 'Ski Team Data', a description field with 'Tutorial data based on the Ski Team business.', and a '+ Add tags' button. Below the description section is a list of settings: 'Connection Settings', 'Connection Pool', 'Security' (with a lock icon), 'Access Filters', 'Usage Parameters', and 'Views and Content'. Each setting has an expand/collapse arrow. A 'Save' button is located in the top right corner of the main area.

Connection Settings

These are the connection parameters that need to be defined in order for Yellowfin to know how to access your database.

You will be presented with a list of parameters that relates to the type of database you have chosen to connect to, as each database may require different options.

+

Connection

Let's make this easy.

You can edit and manage your data source connection parameters here.

This includes Connection Settings, Security, and Access Filters.

Need help?

Visit the [Yellowfin forum](#) or [wiki](#) to find the answers you are looking for.

✓

Availability

Available. The connection to this Data Source was successful.

Connection

Connection Description

Connection Settings

Connection Method

Specify the type of connection required.

JDBC

▼

Authentication Adapter

Specify if you wish to use the standard database authentication method, or pass through system user authentication to the database.

Standard Authentication

▼

Database Type

Specify the type of database to connect to.

Microsoft SQL Server

▼

Include Schema in SQL

Include the schema name when addressing tables in SQL queries.

✓

Database Host

Specify the name of the server hosting the database.

localhost

Use Named Instance

Specify the name of the SQL Server instance.

☐

Database Port

Define the TCP/IP port number the database is running on.

1433

Database Name

Specify the name of the database.

NewSkiTeam

Database Authentication

SQL Authentication

Min Connections

Define the minimum number of connections to be open simultaneously.

1

Max Connections

Define the maximum number of connections to be open simultaneously.

5

Refresh Time

Define the number of hours between connection resets.

3

Timeout

Define the seconds a connection can remain open before it is closed.

180

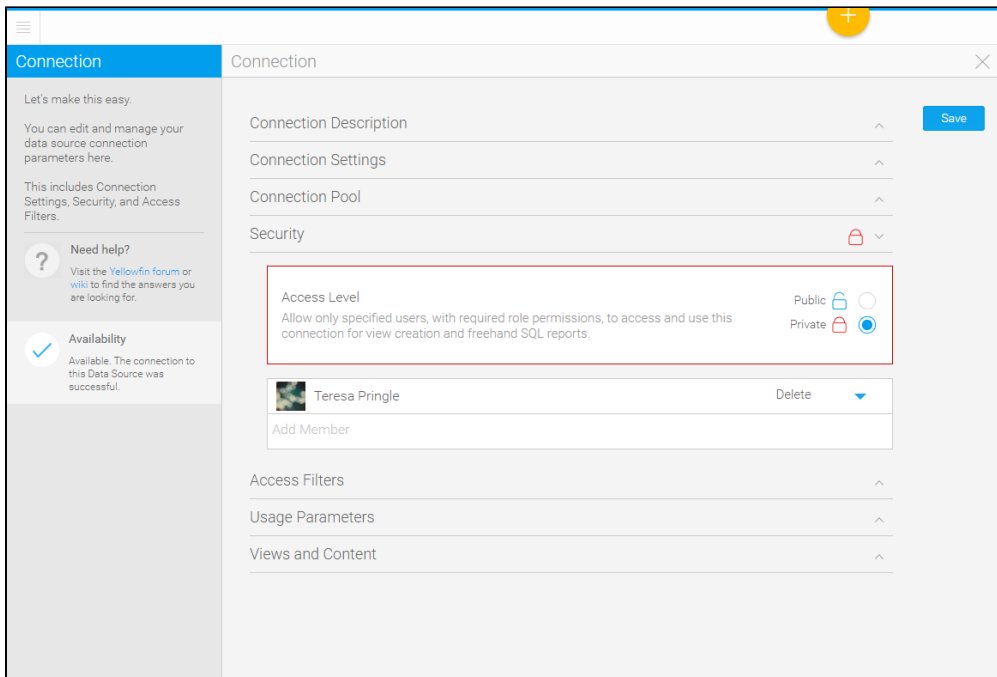

Use secondary pool

Enable the use of a secondary connection pool for this database, for the purposes of running background tasks.

☐

Security

This section allows you to define who has access to this data source connection, and what they can do with it.

There are two main options available:

1. **Public:** allow all users with required role permissions to access and use this connection for view creation and freehand SQL reports.
2. **Private:** allow only specified users, with required role permissions, to access and use this connection for view creation and freehand SQL reports.

If you set the data source to **private** you will then need to define specific users, or groups of users, to have access to the connection. Each user can be assigned one of the following levels of access;

1. **Read:** allows users to see views based on this data source in the data sources and views page, and when creating a report.
2. **Update:** allows users to create, edit, or copy either a view or freehand SQL report based on this data source, as well as the above **Read** level of access.
3. **Delete:** allows the user to **Delete** this data source connection, as well as both of the above **Read** and **Update** levels of access.

Access Filters

This list allows you to add new, and manage existing, access filters.
